
7 AFFORDABLE AND CLEAN ENERGY – Noémi Leonte

Affordable and clean energy is a pressing issue that affects communities across the globe. The goal wants to ensure that everyone has access to modern and reliable sources of energy, while reducing greenhouse gas emissions and pollution. The United Nations Sustainable Development Goal (SDG) 7 aims to secure access to affordable, reliable, sustainable, and modern energy for all by 2030.

This goal is critical to creating a more sustainable future, fighting climate change, and promoting economic development. In order to achieve affordable and clean energy, several projects and initiatives can be pursued. This includes investing in renewable energy infrastructure, improving energy efficiency and promoting energy savings. Here is a project that can help move towards affordable and clean energy:

Energy Storage Solutions: Energy storage solutions are important for integrating renewable energy sources into the power grid. By storing excess energy generated by renewable sources such as wind and sunlight, energy storage solutions can help ensure a constant and reliable supply of energy. This technology is critical for promoting renewable energy and reducing reliance on non-renewable sources.

Since I live in a small area, I think that this would be the best solution. I technically live in a countryside surrounded by trees, so we do not have enough space for wind generators, except for some solar panels on the rooftop.

In conclusion, affordable and clean energy is an essential global challenge that requires collective action from governments and businesses. Some small projects can assist towards the goal of affordable and clean energy. By investing in renewable energy infrastructure, improving energy efficiency, and promoting energy conservation, we can ensure a sustainable and equitable future for all. It is time to prioritize affordable and clean energy to fight climate change and create a better world for future generations.
